## 1. User Stories

Based on student responses and the minimum required functionalities, here are the user stories:

1. As a resident, I want to see a list of all the blocks and apartments, so what I can understand the layout of the complex.
2. As a resident, I want to make online payments for administrative services, so what I can conveniently manage my financial obligations.
3. As a resident, I want to make reservations for common spaces, so what I can plan social gatherings or personal activities.
4. As a resident, I want to pay rent online to avoid the hassle of writing and mailing checks.
5. As a resident, I want to report maintenance issues through the app, so what I can quickly notify management about problems in my apartment.
6. As a resident, I want to see available parking spaces in real time, so what I can easily find a spot for my vehicle.
7. As a resident, I want to reserve laundry machines so what I can guarantee availability when I need to do laundry.
8. As a resident, I want to receive notifications about package deliveries, so what I can pick them up on time.
9. As a resident, I want to have access to a community bulletin board for events and announcements so what I can stay informed about complex activities.
10. As a resident, I want to communicate with management easily through the app, so what I can get quick responses to my inquiries.
11. As a resident, I want to split bills with my roommates, so what I can fairly divide shared expenses.
12. As a resident, I want to see my lease and other documents, so what I can refer to them as needed without having to search for physical copies.
13. As a resident, I want to file noise complaints, so what I can report nuisances and maintain a quiet living environment.
14. As a resident, I want to see my apartment's energy usage statistics, so what I can monitor and potentially reduce my energy consumption.
15. As a resident, I want to apply for utility access cards, so what I can easily access the complex's facilities.
16. As a resident, I want to renew my lease through the app, so what I can conveniently extend my stay without paperwork.

17. As a resident, I want to access a marketplace to buy and sell items, so what I can transact with other residents.
18. As a resident, I want to see a calendar of maintenance schedules for my apartment, so what I can plan for upcoming maintenance work.

## **2. Technical and Design Considerations/Decisions**

### **1. Architecture**

- We will use a microservices architecture to ensure scalability and easier maintenance of individual functions.

### **2. Database**

- We will use a relational database (PostgreSQL) for structured data such as user, apartment and transaction information. For real-time functions such as parking availability, we will use a NoSQL database (MongoDB) for better performance.

### **3. Authentication**

- We will implement JWT (JSON Web Tokens) for secure authentication and authorization.

### **4. Payment integration**

- we will use a third-party payment gateway (e.g. Stripe) to handle rental and other payments securely.

### **5. Real-time updates**

- we will use WebSockets for real-time functions such as parking availability and community board updates.

### **6. File storage**

- to store documents such as lease agreements, we will use cloud storage (e.g., AWS S3) for scalability and reliability.

### **7. Notifications**

- We will implement push notifications for package deliveries and other important alerts.

### **8. Mobile responsiveness**

- The application will be designed with a mobile focus to ensure a good user experience on all devices.

### **9. API design**

- We will create a RESTful API for communication between frontend and backend services.

### **10. Security**

- We will implement HTTPS for all communications and use encryption for sensitive data storage.

### **3.Database design (10-step methodology)**

#### ***1. Determine the purpose of the database***

The purpose is to manage all aspects of an apartment complex, including resident information, apartments, payments, reservations, and various resident services.

#### ***2. Find and organize the required information***

Information includes residents, apartments, blocks, payments, reservations, maintenance requests, parking spaces, packages, community events, energy usage, amenities, and leases.

#### ***3. Divide the information into tables.***

Tables: Users, Apartments, Blocks, Payments, Reservations, Maintenance requests, Parking spaces, Packages, Community events, Energy use, Amenities, Leases.

#### ***4. Convert data elements into columns***

Example for the Users table: User ID, First Name, Last Name, Email, Phone, Apartment ID

#### ***5. Specify primary keys***

Example: UserID for table Users, ApartmentID for table Apartments

#### ***6. Establish table relationships***

Example: Users to apartments (one to many), apartments to blocks (many to one)

#### ***7. Refine the layout***

Add indexes for frequently searched columns

Normalize tables to reduce data redundancy

#### ***8. Apply normalization rules***

Ensure tables are at least in 3NF (third normal form)

#### ***9. Create the physical database design***

Define data types for each column

Set constraints (e.g. NOT NULL, UNIQUE)

#### ***10. Create views and implement security mechanisms***

Create views for common queries (e.g. ApartmentDetails, UserPayments)

## Implement role-based access control
